Virtual Destructors

```
// virt_dtor.h

class Base {
public:
    Base() : base_memory(new char[1000]) { }
    ~Base() { delete[] base_memory; }

private:
    char *base_memory;
};

class Derived : public Base {
public:
    Derived() : Base(), derived_memory(new char[1000]) { }
    ~Derived() { delete[] derived_memory; }

private:
    char *derived_memory;
};
```

Virtual Destructors

```
// virt_dtor.cpp

#include "virt_dtor.h"

int main() {
    // Note use of base-class pointer
    Base *obj = new Derived();
    delete obj; // calls what destructor(s)?
    return 0;
}
```

`new Derived()` calls `Derived` default constructor, which in turn calls `Base` default constructor; that's good (both memories are allocated)

But which destructor is called?

- Destructor is not `virtual`
- Does that mean `~Base` is called but not `~Derived`?

Virtual Destructors

```
$ g++ -o virt_dtor virt_dtor.cpp -std=c++11 -pedantic -Wall -Wextra
$ valgrind --leak-check=full ./virt_dtor

Virtual Destructors

```
// virt_dtor2.h

class Base {
public:
    Base() : base_memory(new char[1000]) { }
    virtual ~Base() { delete[] base_memory; }

private:
    char *base_memory;
};

class Derived : public Base {
public:
    Derived() : Base(), derived_memory(new char[1000]) { }
    virtual ~Derived() { delete[] derived_memory; }

private:
    char *derived_memory;
};
```

Virtual Destructors

```
// virt_dtor2.cpp

#include "virt_dtor2.h"

int main() {
    // Note use of base-class pointer
    Base *obj = new Derived();
    delete obj; // calls what destructor(s)?
    return 0;
}
```

This should fix the problem. Thanks to dynamic binding, `delete obj` calls `~Derived`, which in turn calls `~Base`

Recall: derived-class destructor always implicitly calls base=class destructor

Virtual Destructors

```
$ g++ -o virt_dtor2 virt_dtor2.cpp -std=c++11 -pedantic -Wall -Wextra

$ valgrind --leak-check=full ./virt_dtor2

Virtual Destructors

To avoid this in general: **Any** `class` with **virtual member functions** should also have a `virtual` destructor, even if the destructor does nothing

Quiz - answers

Assume `class C` is derived from `class A` and `class B` and `class D` is derived from `class B`. If `class A` and `class B` both have `virtual` member functions, at the very least, the destructors of which classes must be `virtual`?

A. C and D

B. A and B

C. A, B and C

D. A, B, C and D

E. D only
