

C++ references

Reference variable is an *alias*, another name for an existing variable (memory location)

- Used in many situations where pointers would be used in C
- References have *restrictions* that make them *safer*:
 - Cannot be *NULL*
 - Must be initialized immediately
 - Once set to alias a variable, cannot later be set to alias another

C++ references

To declare a reference of type `int`, use `int&`

- The `&` comes after the type
- Might remind you of the *address of* operator, but it is not the same

C++ references

References provide pointer-like functionality while hiding the **raw** pointers themselves

```
// ref1.cpp
```

```
1  #include <iostream>
2
3  int main() {
4      int i = 1;
5      int *j = &i;
6      std::cout << "i=" << i << ", *j=" << *j << std::endl;
7
8      i = 9;
9      std::cout << "i=" << i << ", *j=" << *j << std::endl;
10     return 0;
11 }
```

```
$ g++ -o ref1 ref1.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref1
```

```
i=1, *j=1
```

```
i=9, *j=9
```

C++ references

// ref2.cpp

```
1  #include <iostream>
2
3  int main() {
4      int i = 1;
5      int& j = i;
6      std::cout << "i=" << i << ", j=" << j << std::endl;
7
8      i = 9;
9      std::cout << "i=" << i << ", j=" << j << std::endl;
10     return 0;
11 }
```

```
$ g++ -o ref2 ref2.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref2
```

```
i=1, j=1
```

```
i=9, j=9
```

C++ references

```
// ref3.cpp
```

```
1  #include <iostream>
2
3  int main() {
4      int a = 5;
5      int& b = a;
6      // now b is "just another name for" a
7      int* c = &a;
8      // c is a "pointer" pointing to a
9      std::cout << "&a=" << &a << std::endl;
10     std::cout << "&b=" << &b << std::endl;
11     std::cout << "&c=" << &c << std::endl;
12     std::cout << "c=" << c << std::endl;
13     return 0;
14 }
```

```
$ g++ -o ref3 ref3.cpp -std=c++11 -pedantic -Wall -Wextra
$ ./ref3
&a=0x7fffe0a7e864
&b=0x7fffe0a7e864
&c=0x7fffe0a7e868
c=0x7fffe0a7e864
```

C++ references

Function parameters with reference type are passed **by reference** – like passing **by pointer** but **without the extra syntax** inside the function

```
// ref4.cpp
```

```
1  // if you have int a = 1, b = 2; then call  
2  // like this: swap(a, b) -- no ampersands!  
3  void swap(int& a, int& b) {  
4      int tmp = a;  
5      a = b;  
6      b = tmp;  
7  }
```

C++ references

```
// ref5.cpp
```

```
1  #include <iostream>
2
3  void swap(int& a, int& b) {
4      int tmp = a;
5      a = b;
6      b = tmp;
7  }
8  int main() {
9      int a = 1, b = 9;
10     swap(a, b);
11     std::cout << "a=" << a << ", b=" << b << std::endl;
12     return 0;
13 }
```

```
$ g++ -o ref5 ref5.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref5
```

```
a=9, b=1
```

At line 11:

Symbols (Scope)	Values
a (main)	9
b (main)	1

C++ references

Recall this example; `ch` passed by reference to `cin.get(char&)`

// ref6.cpp

```
1  #include <iostream>
2  #include <cctype>
3
4  int main() {
5      char ch;
6      // read standard input char by char
7      while(std::cin.get(ch)) { // pass ch by reference!
8          std::cout << toupper(ch);
9      }
10     std::cout << std::endl;
11     return 0;
12 }
```

C++ references

C++ has **both** pass by value (non-reference parameters) **and** pass by reference (reference parameters)

Function can have a mix of pass-by-value and pass-by-reference parameters

C++ references

```
// ref7.cpp
1  #include <iostream>
2
3  // 'int a' and 'int b' are passed *by value*
4  // 'int& quo' and 'int& rem' are passed *by reference*
5  void divmod(int a, int b, int& quo, int& rem) {
6      quo = a / b;
7      rem = a % b;
8  }
9
10 int main() {
11     int a = 10, b = 3, quo, rem;
12     divmod(a, b, quo, rem);
13     std::cout << "a=" << a << ", b=" << b
14         << ", quo=" << quo << ", rem=" << rem << std::endl;
15     return 0;
16 }

$ g++ -o ref7 ref7.cpp -std=c++11 -pedantic -Wall -Wextra
$ ./ref7
a=10, b=3, quo=3, rem=1
```

C++ references

Unfortunately, looking at the call itself doesn't tell you which parameters are passed by value and which are passed by reference:

```
divmod(a, b, quo, rem); // ???
```

Rather, you have to go look at the callee's parameter types:

```
void divmod(int a, int b, int& quo, int& rem) {  
    ...  
}
```

C++ references

C++ also has pointers, so you can still use the pass-by-pointer *workaround*:

```
// ref8.cpp
```

```
1  // this is still OK
2  void swap(int *a, int *b) {
3      int tmp = *a;
4      *a = *b;
5      *b = tmp;
6  }
7
8  // this is still OK
9  int a = 1, b = 2;
10 swap(&a, &b);
```

C++ references

Can we return a reference? **Yes**

// ref9.cpp

```
1  #include <iostream>
2
3  // Return reference to minimum argument
4  int& minref(int& a, int& b) {
5      if(a < b) {
6          return a;
7      } else {
8          return b;
9      }
10 }
11
12 int main() {
13     int a = 5, b = 10;
14     int& min = minref(a, b);
15     min = 12;
16     std::cout << "a=" << a << ", b=" << b << ", min=" << min << std::endl;
17 }
```

At line 16:

Symbols (Scope)	Values
a (main), min (main)	12
b (main)	10

C++ references

```
$ g++ -o ref9 ref9.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref9
```

```
a=12, b=10, min=12
```

`minref` returns a reference to `int` `a`. When we later assign `min = 12`, we change both `min` and `a`.

What if we make `minref`'s arguments non-references?

C++ references

```
// ref10.cpp
1  #include <iostream>
2
3  int& minref(int a, int b) {
4      if(a < b) {
5          return a;
6      } else {
7          return b;
8      }
9  }
10
11 int main() {
12     int a = 5, b = 10;
13     int& min = minref(a, b);
14     min = 6;
15     std::cout << "a=" << a << ", b=" << b << ", min=" << min << std::endl;
16 }
```

```
$ g++ -o ref10 ref10.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
ref10.cpp: In function int& minref(int, int):
```

```
ref10.cpp:3:17: warning: reference to local variable a returned [-Wreturn-local-addr]
```

```
    int& minref(int a, int b) {
        ~~~~~
```

```
ref10.cpp:3:24: warning: reference to local variable b returned [-Wreturn-local-addr]
```

```
    int& minref(int a, int b) {
        ~~~~~
```

C++ references

Returning a reference to a local variable is just as bad as returning a pointer to one. In our original `minref` function, we avoided this by making the parameters themselves references.

```
int& minref(int& a, int& b) {  
    if(a < b) {  
        return a;  
    } else {  
        return b;  
    }  
}
```

C++ references

Once a reference is set to alias a variable, it cannot later be set to alias another variable

Let's see an example

C++ references

// ref11.cpp

```
1  #include <iostream>
2
3  int main() {
4      int a = 5, b = 10;
5      int& c = a;
6      std::cout << "a=" << a << ", c=" << c << std::endl;
7      c = b;
8      std::cout << "a=" << a << ", c=" << c << std::endl;
9      return 0;
10 }
```

```
$ g++ -o ref11 ref11.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref11
```

a=5, c=5

a=10, c=10

c = b assigns b's value (10) to c (and therefore also to a)

C++ references

A reference variable **must be initialized immediately.**

// ref12.cpp

```
1  #include <iostream>
2
3  int main() {
4      int& a;
5      int b = 10;
6      a = b;
7      std::cout << a << std::endl;
8      return 0;
9  }
```

```
$ g++ -o ref12 ref12.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
ref12.cpp: In function int main():
```

```
ref12.cpp:4:10: error: a declared as reference but not initialized
    int& a;
    ^
```

C++ references

A reference **cannot be NULL**

// ref13.cpp

```
1  #include <iostream>
2
3  int main() {
4      int& a = NULL;
5      if(a == NULL) {
6          std::cout << "a is NULL" << std::endl;
7      }
8      return 0;
9  }
```

\$ g++ -o ref13 ref13.cpp -std=c++11 -pedantic -Wall -Wextra

ref13.cpp: In function int main():

ref13.cpp:4:14: warning: converting to non-pointer type int from NULL [-Wconversion]
 int& a = NULL;
 ~~~~

# C++ references

A reference can be `const` – if so, can't subsequently assign via that reference

...but you can still assign to the original non-const variable, or via a non-const reference to it

# C++ references

```
// ref14.cpp
```

```
1  #include <iostream>
2
3  int main() {
4      int a = 1;
5      int& b = a;
6      const int& c = a;
7      a = 2;
8      std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
9      b = 3;
10     std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
11     c = 4;
12     std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
13     return 0;
14 }
```

```
$ g++ -o ref14 ref14.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
ref14.cpp: In function int main():
```

```
ref14.cpp:11:13: error: assignment of read-only reference c
```

```
    c = 4;
    ^
```

# C++ references

```
// ref15.cpp
```

```
1  #include <iostream>
2
3  int main() {
4      int a = 1;
5      int& b = a;
6      const int& c = a;
7      a = 2;
8      std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
9      b = 3;
10     std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
11     //c = 4;
12     //std::cout << "a=" << a << ", b=" << b << ", c=" << c << std::endl;
13     return 0;
14 }
```

```
$ g++ -o ref15 ref15.cpp -std=c++11 -pedantic -Wall -Wextra
```

```
$ ./ref15
```

```
a=2, b=2, c=2
```

```
a=3, b=3, c=3
```

# C++ references

We've seen the difference between pass by reference and pass by value

In C++, when passing objects, we generally pass by reference

- `const` reference if modification is not permitted
- Normal reference otherwise

# Quiz!

What is the output of the following program?

```
1  #include <iostream>
2  void times3(int& x) {
3      x *= 3;
4  }
5
6  int main() {
7      int a = 2;
8      int b = a;
9      int& c = a;
10     times3(a);
11     times3(b);
12     times3(c);
13     std::cout << a << ", " << b << ", " << c << std::endl;
14     return 0;
15 }
```

A. 6, 2, 6

B. 6, 6, 6

C. 6, 18, 18

D. 18, 6, 18

E. The program doesn't compile

## Quiz - answer

What is the output of the following program?

```
1  #include <iostream>
2  void times3(int& x) {
3      x *= 3;
4  }
5
6  int main() {
7      int a = 2;
8      int b = a;
9      int& c = a;
10     times3(a);
11     times3(b);
12     times3(c);
13     std::cout << a << ", " << b << ", " << c << std::endl;
14     return 0;
15 }
```

At line 13:

| Symbols (Scope)    | Values |
|--------------------|--------|
| a (main), c (main) | 18     |
| b (main)           | 6      |

## C++ objects: passing by reference

Question: What's the difference between passing by `const` reference and passing by value?

```
int sum(vector<int> vec) { ... };
```

```
int sum(const vector<int>& vec) { ... };
```

First form creates a copy, second form doesn't.

Essentially no downside, which is one big reason we usually pass class objects by reference

Another reason is related to dynamic binding, as we'll see later

# C++ references

You should be able to tell the differences among below functions:

```
void func(int a, int b);
```

```
void func(const int a, const int b);
```

```
void func(int& a, int& b);
```

```
void func(const int& a, const int& b);
```

```
void func(int* a, int* b);
```

```
void func(const int* a , const int* b);
```
